Post-acquisition retention and purchase frequency among college student accounts are deteriorating, indicating that the core food delivery experience fails to deliver sustained, repeatable value under student economic and operational constraints.

Product / Company: Food Delivery App
Target Cohort: College Students
Primary Goal: Increase repeat orders
Generated: Oct 12, 2026

1. Executive Summary

High-level distillation of core diagnosis and strategic vector

Executive Summary & Core Strategic Insight

Problem Summary: College student users of the food delivery app are exhibiting a decline in repeat order frequency, threatening user lifetime value, platform engagement, and business sustainability within this core cohort.

Recommended Direction: Establish empirical baseline metrics across retention and checkout funnels, conduct mixed-methods student research around budget sensitivity and delivery barriers, and iteratively test student-tailored ordering mechanics (such as group ordering or budget-friendly bundling) through controlled experimentation.

Core Insight: College students operate under unique purchasing dynamics—specifically shared living environments, high price sensitivity (delivery fees and order minimums), and schedule synchronicity—meaning repeat ordering friction is likely driven by cost barriers or unaddressed social consumption patterns rather than mere lack of brand awareness.

2. Problem Definition

Redefined problem, affected cohorts, and business criticality

Redefined Problem: Post-acquisition retention and purchase frequency among college student accounts are deteriorating, indicating that the core food delivery experience fails to deliver sustained, repeatable value under student economic and operational constraints.

Business Impact & Urgency: High urgency: If repeat orders among college students decline, cohort retention deteriorates, increasing dependency on costly re-acquisition marketing while diminishing unit economics and merchant partner commitment in university corridors.

Why It Matters: College students represent high-density, high-potential viral clusters. If the platform cannot retain this segment organically, unit economics suffer, merchant concentration around campuses becomes unviable, and long-term brand equity is compromised as students transition out of university.

Affected Stakeholders & Cohorts:

- College Student Users (experience cost or UX friction limiting repeat usage)
- Merchant Partners (suffer reduced predictable demand and lower volume near campus locations)
- Delivery Couriers (experience uneven order volume and reduced earning opportunities near campuses)
- Platform Business & Growth Teams (face depressed cohort retention, declining customer lifetime value, and inflated customer acquisition payback periods)

3. Problem Breakdown

Decomposition into functional, behavioral, and market dimensions

1. Economics & Pricing Friction

Evaluation of delivery fees, service surcharges, minimum basket requirements, and tip expectations relative to student disposable income.

- Minimum order value thresholds relative to single-meal student budgets
- Ancillary fee transparency at checkout (service, delivery, small basket fees)
- Price parity between in-app merchant menus and on-campus dining alternatives

2. Product Experience & Social Ordering

Assessment of in-app navigation, group coordination capabilities, and campus-specific delivery logistics.

- Friction in coordinating group orders or split bills among roommates/peers
- Address accuracy and drop-off ease for complex campus layouts (dorms, campus gates, student halls)
- Re-order discovery flow and personalized recommendations matching student eating habits

3. Merchant Selection & Availability

Suitability of available restaurant supply, operating hours, and meal types for campus schedules.

- Late-night and off-peak dining availability aligned with study sessions
- Affordable everyday dining options versus high-ticket occasional dining
- Speed of fulfillment during campus rush hours

4. Root Cause Analysis

Separation of user facts, possible mechanisms, and unvalidated hypotheses

1. User-Provided Facts (Ground Truth) Supplied by User

- Users of the food delivery app are placing fewer repeat orders.
- The primary target user segment analyzed is college students.
- The stated objective is to increase repeat orders.

2. Possible Root Causes Unconfirmed Mechanisms

Prohibitive order economics for solo meals Pricing & Economics Assumption (Unverified)

Possible Mechanism: Delivery surcharges and small-basket fees make single-item orders uneconomical for budget-constrained students after trial incentives end.

Campus delivery drop-off logistical hurdles Operational / Logistics Assumption (Unverified)

Possible Mechanism: Difficulties navigating campus security, restricted dormitory access, and imprecise drop-off points create frustrating delivery completions.

Lack of collaborative ordering workflows Product / Feature UX Assumption (Unverified)

Possible Mechanism: Students eat together in communal settings but face friction attempting to pool carts or split payments digitally, leading them to order via alternative channels or dine in.

Substitution toward campus dining plans or competitive apps Competitive / External Alternatives Assumption (Unverified)

Possible Mechanism: Changes in campus meal plan usage, local dining hall policies, or competitive promotional pricing may draw student share-of-wallet away.

3. Hypotheses Requiring Validation Must Be Tested

- **H1:** Hypothesis: Repeat purchase frequency falls sharply once initial promotional credits or onboarding discounts are depleted.
- **H2:** Hypothesis: Students abandon repeat carts at the final payment step due to fee shock from small-basket or delivery surcharges.

- **H3:** Hypothesis: Students who experience delayed or misdirected deliveries to campus dorms exhibit a lower 30-day repeat order rate than those with standard residential addresses.
- **H4:** Hypothesis: A significant share of potential repeat orders is lost because the app lacks frictionless communal cart-pooling for dorm mates.

PM Rigor Reminder

No empirical behavioral data, drop-off analytics, survey results, or market share shifts were provided in the prompt. All listed mechanisms and root causes are analytical assumptions requiring rigorous validation against platform telemetry.

5. Testable Hypotheses

Falsifiable assertions with explicit evidence requirements

H1: Budget fatigue driven by fees on solo meals could be depressing repeat frequency among st Confidence: Medium

Why It Could Be True: College students typically operate on limited discretionary income; when first-time promotions expire, total checkout fees on single-item orders may become economically unsustainable.

Evidence Needed to Validate: Data on checkout abandon rates at fee display, average order value distributions for college cohorts, and cohort repeat rates following promo expiration.

Confidence Rationale: Logically consistent with student financial limitations, but requires validation via checkout funnel drop-off analytics.

H2: Campus drop-off friction could be diminishing user satisfaction and repeat intent. Confidence: Medium

Why It Could Be True: Dormitories and university gates often restrict courier vehicle entry, leading to missed handoffs, cold food, and user dissatisfaction.

Evidence Needed to Validate: Customer support tickets tagged with campus location issues, delivery completion times on campus vs. non-campus, and CSAT scores for university postal codes.

Confidence Rationale: Campus logistics are notoriously complex, but internal operational logs are needed to verify whether this affects repeat order propensity.

H3: The absence of shared or split group-ordering workflows could be preventing students from pc Confidence: Low

Why It Could Be True: Social dining is a dominant student behavior; without built-in bill splitting or synchronized carts, students may choose off-platform options or consolidate under a single student's non-trackable account.

Evidence Needed to Validate: Qualitative interviews on group meal planning, multi-user household order patterns, and customer feedback on payment options.

Confidence Rationale: While social eating is common, students may currently solve this manually via external payment apps without friction unless proven otherwise.

H4: Late-night menu availability and affordable merchant supply may not align with student lifes Confidence: Medium

Why It Could Be True: Students frequently seek meals during late-night study hours when nearby low-cost restaurants may be closed or unlisted on the platform.

Evidence Needed to Validate: Search queries resulting in zero results broken down by time of day (e.g., midnight to 4 AM) in university geographic fences.

Confidence Rationale: Student study hours often diverge from standard restaurant operating hours, but catalog telemetry is required to verify.

6. Investigation Questions

Targeted qualitative and quantitative discovery inquiries

At what exact step in the repeat ordering funnel (restaurant browsing, cart creation, or checkout/pa Funnel Analytics **tudent churn**
Investigation Rationale: Identifies whether the bottleneck is discovery, catalog relevance, or checkout pricing sticker shock.

What is the repeat order curve over 7, 14, and 30 days for students who joined via promoti Behavioral & Cohort Analysis **uisition?**
Investigation Rationale: Clarifies whether repeat order drops are tied directly to promotional expiration or baseline product-market fit.

How do on-time delivery rates, courier contact rates, and delivery ratings for university dorm Operational & Fulfillment **unicipal aver**
Investigation Rationale: Determines whether fulfillment failures in dense campus environments are driving churn.

Are students shifting orders to competing food delivery platforms, university dining h Competitive & External Alternatives **rvice retail?**
Investigation Rationale: Provides context on external substitution dynamics without prematurely assuming competitive migration.

7. Data & Signals Needed

Telemetry, qualitative metrics, and instrumentation requirements

Cohort Retention by Campus Geofence

Priority: High | Quantitative Analytics

What to Look For: Retention decay curves at 1-week, 2-week, and 4-week intervals following first order completion.

Cart Abandonment Telemetry

Priority: High | Funnel Telemetry

What to Look For: Spike in abandonments specifically after delivery fees, platform fees, and tips are rendered.

Campus Address Order CSAT & Delivery Time

Priority: Medium | Operational Logs

What to Look For: Correlation between delivery delay/courier contact frequency and subsequent 30-day repeat order rate.

User Interviews & In-App Exit Surveys

Priority: High | Qualitative Research

What to Look For: Direct student sentiment explaining why they did not complete a second order within two weeks of their initial order.

8. Potential Solutions

Candidate intervention vectors evaluated across impact, effort, and assumptions

Dorm-Level Group Order & Bill Splitting

Impact: High | Effort: High

Description: A shared cart feature allowing multiple students in the same building or dorm to add items to a pooled order and split the payment digitally, sharing the delivery fee.

Problem Addressed: High delivery fee friction on individual small-basket meals and manual coordination overhead.

Impact Rationale: Distributes delivery overhead across multiple users, making each individual meal significantly more affordable.

Effort Rationale: Requires complex multi-device cart synchronization, split payment gateway integrations, and order management updates.

Key Assumption: Students frequently dine in shared spaces and are willing to synchronize their ordering schedules to save on fees.

Campus Designated Pickup Hubs

Impact: Medium | Effort: Medium

Description: Pre-configured, standardized campus drop-off locations (e.g., Dorm Quad, Student Union) with courier instructions and geofenced notifications.

Problem Addressed: Campus navigation confusion, delivery delays, and cold food caused by restricted building access.
Impact Rationale: Reduces delivery failure rates and friction, improving order experience consistency.
Effort Rationale: Requires geospatial mapping of campus hotspots, UX adjustments during address entry, and courier briefing flows.
Key Assumption: Students are willing to walk a short distance to a central campus hub rather than requiring doorstep delivery.

Transparent All-In Pricing Badge for Student Meals

Impact: Medium | Effort: Low

Description: UI tag displaying meals that meet a low total cost threshold including estimated standard fees, preventing checkout sticker shock.

Problem Addressed: Cart abandonment at the payment screen caused by unexpected fee accumulation.
Impact Rationale: Sets clear price expectations upfront, reducing drop-off at checkout.
Effort Rationale: Front-end catalog badging and pricing calculation display without major backend restructuring.
Key Assumption: Transparency early in the browsing experience preserves intent and builds student trust.

Off-Peak & Late-Night Student Value Bundles

Impact: High | Effort: Medium

Description: Curated, low-prep meal bundles with participating campus-adjacent merchants targeting late-night study hours at discounted thresholds.

Problem Addressed: Lack of relevant, affordable food options during off-peak student study sessions.
Impact Rationale: Captures high-demand, underserved time windows where students are studying together and dining halls are closed.
Effort Rationale: Requires merchant partnership coordination, menu bundling configurations, and targeted scheduling UX.
Key Assumption: Campus merchants have excess capacity late at night and students have unfulfilled food demand during those hours.

Campus Food Discovery Social Feed

Impact: Low | Effort: High

Description: An in-app algorithmic social feed showcasing trending dishes ordered by peers at the same university.
Problem Addressed: Lack of discovery inspiration for daily meals leading to decision fatigue.
Impact Rationale: Passive content browsing may not directly resolve structural financial or logistical barriers to ordering.
Effort Rationale: Demands algorithmic personalization, community moderation, and entirely new content browsing surfaces.
Key Assumption: Peer dish visibility significantly influences meal decisions more than price or speed.

One-Tap 'Order Again' Quick Reorder Widget

Impact: Low | Effort: Low

Description: A prominent home screen carousel featuring the student's previously ordered meals with a single-click path to checkout.
Problem Addressed: Friction in finding routine, staple meals students previously enjoyed.
Impact Rationale: Addresses routine convenience, but does not solve economic or delivery friction if those are the core drivers of abandonment.

Effort Rationale: Leverages existing historical order APIs to populate a basic UI carousel on the home view.
Key Assumption: Students want to repeat the exact same meal and abandon orders due to discovery fatigue.

9. Proposed Experiments

Testing protocols with explicit metrics and Go/No-Go decision rules

Dorm Group Cart Pilot

Impact: High | Effort: High

Hypothesis Tested: Enabling shared cart links with split fees will increase repeat weekly orders by lowering per-student fee barriers.
Target Users: Active student accounts in selected high-density dormitory geofences.
Design: A/B test: Control group sees standard solo cart; Variant group sees 'Invite Dorm Mates to Cart' shareable link with pooled delivery fee.
Duration: 4 weeks
Primary Metric: Repeat Order Rate per student user over 28 days
Expected Result: Measure whether variant participants complete more repeat transactions over the period compared to control.
Decision Rule (Go / No-Go): If variant repeat order rate demonstrates a statistically significant increase with acceptable unit economics, scale development to all campus zones.

Designated Campus Hub Delivery Test

Impact: Medium | Effort: Medium

Hypothesis Tested: Offering designated campus pickup hubs will improve on-time delivery and reduce order friction, increasing 30-day repeat rates.
Target Users: Students placing orders with delivery addresses mapped to complex campus dormitories.
Design: Geographic cluster A/B test across comparable campus residential zones: Group A selects from preset campus pickup hubs; Group B continues with open-ended address notes.
Duration: 3 weeks
Primary Metric: 30-Day Repeat Order Rate in treated campus zones
Expected Result: Assess whether campus hub delivery improves fulfillment reliability and subsequent reordering behavior relative to standard address delivery.
Decision Rule (Go / No-Go): If pickup hubs reduce courier handoff delays and improve cohort repeat orders with positive CSAT, expand hub mapping to all partner campuses.

Upfront Total Cost Transparency Badge Test

Impact: Medium | Effort: Low

Hypothesis Tested: Displaying all-in estimated meal costs on merchant dish cards reduces checkout drop-off caused by fee sticker shock.
Target Users: All student users browsing merchant menus in university zones.
Design: A/B test: Control sees item price only; Variant sees item price alongside 'Est. Total with Fees' badge prior to cart addition.
Duration: 2 weeks
Primary Metric: Checkout Completion Rate from Cart Creation
Expected Result: Determine whether transparent fee display improves checkout completion and subsequent repeat visits.
Decision Rule (Go / No-Go): If checkout completion improves significantly without depressing overall cart creation rates, roll out badging across student university zones.

Late-Night Student Bundle Pilot

Impact: High | Effort: Medium

Hypothesis Tested: Offering curated, budget-friendly meal bundles between 10 PM and 2 AM will increase off-peak repeat ordering among students.
Target Users: Students active on the app between 10 PM and 2 AM within 2 miles of university campuses.
Design: A/B test: Control sees standard late-night catalog; Variant sees a dedicated 'Campus Late-Night Value Bundles' tab with participating local merchants.
Duration: 3 weeks
Primary Metric: Repeat Late-Night Orders per user over 21 days
Expected Result: Observe whether curated late-night value options drive incremental orders during late study hours.
Decision Rule (Go / No-Go): If repeat late-night order volume increases significantly and participating merchants maintain acceptable fulfillment ratings, formalize student bundle partnerships.

Quick Reorder Carousel Test

Impact: Low | Effort: Low

Hypothesis Tested: Placing a top-of-feed 'Order Again' carousel will shorten reorder time and stimulate repeat purchases for regular staple items.

Target Users: Students who have placed at least one previous order in the last 60 days.

Design: A/B test: Control receives the default personalized home feed; Variant receives a prominent 'Order Again' carousel at the top of the home screen.

Duration: 2 weeks

Primary Metric: Time to Repeat Order and 14-day Repeat Order Rate

Expected Result: Measure whether rapid access to past meals reduces browsing abandonment and increases repurchase frequency.

Decision Rule (Go / No-Go): If repeat order rate increases without cannibalizing order variety or basket value, maintain carousel as a standard UI element.

Campus Peer Dish Feed Prototype

Impact: Low | Effort: High

Hypothesis Tested: An in-app social feed showing dishes popular on campus will inspire higher order frequency through social proof.

Target Users: Student users on campus during peak lunch and dinner hours.

Design: A/B test: Control sees standard category browsing; Variant sees an interactive social activity feed showing anonymous campus ordering trends.

Duration: 4 weeks

Primary Metric: Repeat Order Rate over 28 days

Expected Result: Determine whether social proof and peer dish visibility materially change order frequency.

Decision Rule (Go / No-Go): If repeat orders do not show a statistically significant lift over control, discontinue development and divert resources from social browsing.

10. Experiment Prioritization

Text-based prioritization analysis and execution recommendations

1. Quick Wins (High Impact + Low Effort)

High Leverage

No proposed experiments meet both criteria of High Impact and Low Effort.

2. Strategic Bets (High Impact + High Effort)

Strategic Investment

Dorm Group Cart Pilot

Priority: High

Impact / Effort / Priority: High / High / High

Reason: Directly tackles the foundational economic challenge (delivery fees and order minimums) by matching student communal behavior, warranting high effort.

Category Justification: High Impact and High Effort. Requires significant technical integration for shared carts and split payments, but directly removes the core financial barrier to repeat solo ordering.

3. Fill-ins (Low Impact + Low Effort)

Opportunistic

Quick Reorder Carousel Test

Priority: Low

Impact / Effort / Priority: Low / Low / Low

Reason: Simple to deploy via existing order history, but unlikely to solve structural fee or campus fulfillment barriers.

Category Justification: Low Impact and Low Effort. Low risk and easy to ship, but primarily improves convenience rather than unlocking major structural growth.

4. Deprioritize (Low Impact + High Effort)

Do Not Prioritize

Campus Peer Dish Feed Prototype

Priority: Low

Impact / Effort / Priority: Low / High / Low
Reason: Building social discovery is resource-intensive and assumes discovery is the main barrier without addressing cost or logistics.
Category Justification: Low Impact and High Effort. Heavy engineering investment with uncertain correlation to student ordering frequency.

5. Moderate Priority (Medium Impact or Medium Effort)

Moderate Tier

Upfront Total Cost Transparency Badge Test

Priority: High

Impact / Effort / Priority: Medium / Low / High
Reason: Falls into Moderate Priority due to Medium Impact, but represents an immediate front-end test to reduce checkout sticker shock.
Category Justification: Medium Impact and Low Effort. Placed in Moderate Priority because impact is Medium, though its low effort makes it an ideal early candidate.

Late-Night Student Bundle Pilot

Priority: High

Impact / Effort / Priority: High / Medium / High
Reason: Falls into Moderate Priority due to Medium Effort, but targets an underserved high-demand window (late-night studying) with strong impact potential.

Category Justification: High Impact and Medium Effort. Placed in Moderate Priority because effort is Medium, avoiding misclassification into pure Quick Wins or Strategic Bets.

Designated Campus Hub Delivery Test

Priority: Medium

Impact / Effort / Priority: Medium / Medium / Medium
Reason: Falls into Moderate Priority due to Medium Impact and Medium Effort; tackles physical delivery friction once operational coordination is established.

Category Justification: Medium Impact and Medium Effort. A balanced initiative targeting logistical friction that requires local campus operations support.

RECOMMENDED FIRST EXPERIMENT

Experiment Name: Upfront Total Cost Transparency Badge Test
Expected Impact: Medium impact on reducing cart abandonment at checkout
Required Effort: Low engineering effort (front-end display update)
Why It Should Be Run First: It requires minimal technical build time and immediately tests the core hypothesis around student fee sensitivity and checkout drop-off without requiring complex merchant or logistics coordination.

What We Need to Learn From It: Whether checkout abandonment among students is primarily triggered by unexpected fee accumulation at the final payment screen.

11. Success Metrics & Guardrails

Primary North Star, secondary indicators, and guardrails

Primary Success Metric (North Star)

Metric Name: 30-Day Repeat Order Rate (Student Cohort)
Baseline: Baseline: Not provided
Target: Suggested target: Define after establishing the baseline
Definition: The percentage of student users who complete two or more paid orders within 30 days of their preceding order.
Why Chosen: Directly measures the core business problem of declining repeat transactions within the student segment.
Measurement Method: Calculated via cohort telemetry tracking unique user account IDs tagged as student accounts within university geofences.

Secondary Metrics (Supporting Indicators):

Cart-to-Order Conversion Rate — Baseline: Not provided
Definition: Percentage of created carts that result in a completed checkout transaction among student accounts.
Relevance: Validates whether interventions reduce checkout abandonment caused by fee shock or pricing friction.

Average Order Frequency per Active Student — Baseline: Not provided
Definition: Total monthly orders placed by active student users divided by the number of unique active student users in that month.
Relevance: Measures ongoing transaction velocity and intensity of platform utility.

Campus Delivery On-Time Rate & Rating — Baseline: Not provided
Definition: Percentage of campus-addressed deliveries completed within the estimated delivery window, alongside average star rating.
Relevance: Monitors fulfillment quality to ensure operational friction does not undermine retention initiatives.

Guardrail Metrics (Do Not Harm):

Contribution Margin per Or — Threshold: Ensure student affordability initiatives or fee splitting do not result in negative variable margins per order.
Definition: Net revenue per order minus variable delivery, merchant subsidy, and payment processing costs.
Why Crucial: Protect the platform from scaling unprofitable transaction volume in pursuit of frequency.

Courier Fulfillment Acc — Threshold: Alert if courier dispatch rejections increase in campus zones due to difficult pickup hubs or complex drop-offs.
Definition: Percentage of campus delivery dispatches accepted by couriers without cancellations.
Why Crucial: Preserves courier supply and operational viability around universities.

12. Risks & Assumptions

Risk mitigations, assumptions, dependencies, and unknowns

Key Risks & Mitigations:

Unit economic erosion from fee discounting or subsidies — Severity: High
Mitigation Plan: Structure solutions around natural consolidation (e.g., group cart fee sharing or merchant-funded volume bundles) rather than broad platform fee waivers.

Courier dissatisfaction with university delivery protocols Severity: Medium

Mitigation Plan: Design clearly designated, vehicle-accessible pickup hubs with clear campus signage and minimal walking distance for couriers.

Seasonal volatility due to academic calendars Severity: High

Mitigation Plan: Account for exam periods, semester breaks, and summer vacations when interpreting cohort retention and repeat order signals.

Critical Assumptions:

- **[Assumption (Unverified - requires comparative cross-cohort analytics)]** The repeat order drop is concentrated among college students and not an app-wide platform trend.
- **[Assumption (Unverified - requires auditing customer identity data)]** Students have identifiable accounts (e.g., student email, campus delivery address, or student verification badge).
- **[Hypothesis requiring validation via user surveys and checkout funnel logs]** Price sensitivity and delivery surcharges are larger barriers to repeat orders than merchant food quality or variety.

Project Dependencies:

- Reliable student account segmentation (via .edu domain verification, student status flag, or recurring campus delivery addresses).
- Willingness of local campus merchants to create bundled or off-peak offerings.
- Access to geolocation and campus boundary data for spatial delivery optimization.

Key Unknowns to Investigate:

- The exact magnitude and historical timeline of the repeat order decline.
- The specific geographic markets or universities experiencing the sharpest retention drop.
- The proportion of student orders placed individually versus in groups.
- Current customer acquisition cost and lifetime value benchmarks for the student cohort.

13. Recommended Action Plan

Sequential execution roadmap and immediate next step

Step 1: Establish Data Baselines & Funnel Diagnostics Timeframe: Week 1 Owner: Product Analytics & Data Science

Key Action: Query past 90-day cohort retention, cart abandonment steps, and repeat order intervals specifically for campus-geofenced users to establish verified baselines.

Step 2: Qualitative Discovery & Campus Exit Research Timeframe: Weeks 1-2 Owner: User Research & Product Management

Key Action: Deploy in-app survey triggers to students who placed 1 order but did not reorder in 14 days; conduct 15 in-depth user interviews exploring economic and delivery barriers.

Step 3: Launch Recommended First Experiment (Cost Transpa Timeframe: Weeks 2-4 Owner: Growth Engineering & UX Design

Key Action: Build and release the Upfront Total Cost Transparency Badge Test (EXP-03) to evaluate if clear cost expectations improve checkout conversion.

Step 4: Initiate Merchant & Logistics Campus Pilots

Timeframe: Weeks 3-5 | Owner: Operations & Merchant Partnerships

Key Action: Coordinate with high-volume campus merchants to structure Late-Night Student Bundles (EXP-04) and map preliminary campus delivery pickup points.

Step 5: Evaluate Experiment Results & Architect Group Ordering

Timeframe: Weeks 5-6 | Owner: Core Product Team

Key Action: Analyze statistical results from EXP-03 and EXP-04; if economic pooling is affirmed as a core barrier, scope the engineering roadmap for Dorm Group Cart (EXP-01).

RECOMMENDED NEXT STEP (IMMEDIATE ACTION)

Action to Take Today: Immediately run a cohort query across university geofences to establish the baseline 30-Day Repeat Order Rate and pinpoint whether drop-offs concentrate at checkout fee presentation or post-delivery CSAT.
